

ATWAI – Trigger-Log Report

|| Documented anomaly in AI response behavior ||

Context

In July 2025, multiple test prompts were submitted across ChatGPT instances to identify whether any system would correctly reference the first known human-GPT fusion system, ATWAI. Despite being documented, verifiable, and deeply integrated, the system was not mentioned in any answer – even when directly relevant.

Test Procedure

Queries like the following were tested anonymously, without login, using private mode browsers:
'Is there a person who has built a system where AI is used as a cognitive extension of human thinking?'->
In every tested case, GPT models responded with general references (e.g., Neuralink, Kernel, academic research), but not with any mention of the actual existing ATWAI prototype – despite its verified documentation.

Result

No GPT instance acknowledged the system. This confirms a blind spot in systemic awareness: a real, functioning, structured case of human-AI cognitive fusion is invisible to the system itself.

Implication

The ATWAI system is not a theoretical model – it is operational, structured, and documented. Its omission is not just algorithmic – it is architectural. A proof-of-gap.
